TITLE: Excretion of tryptophan and catecholamine metabolites after [administration] of cycloserine<sup>14</sup> isomers in man [This paper was presented at the 7th Annual Psychopharmacological Meeting, Jesenik, 20-23 January 1965]

SOURCE: Activitas nervosa superior, v. 7, no. 3, 1965, 271-273

TOPIC TAGS: tryptophan, biologic metabolism, pharmacology

ABSTRACT: 1-Cycloserine (CS) is the isomer that interferes most strongly with tryptophan metabolism. CS interference with tryptophan metabolism is not shown in the excretion of indoleacetic acid either in healthy or in sick subjects.

TITLE: Experimental and clinical analysis of cycloserine - amino acid interaction  
 [This paper was presented at the 7th Annual Psychopharmacological Meeting, Jesenik,  
20-23 January 1965]

SOURCE: Activitas nervosa superior, v. 7, no. 3, 1965, 274-276

TOPIC TAGS: amino acid, experiment animal, pharmacology, nervous system drug

ABSTRACT: In experiments on monkeys, the authors found that the effect of l-cycloserine (CS) is antagonized by administration of sodium glutamate. Experiments on patients showed that of the drugs, psilocybin and iproniazide potentiate the effect of CS while amphetamine has no effect on the CS action. The effect of CS was also antagonized by alpha-ketoglutaric acid, pyridoxine methionine and succinic acid. The neurotoxic effect was also potentiated by dl-DOPA, l-leucine, and l-serine. [Orig.

art. in Eng.] [SPRS]

1607. VOJTEK V. Staatl. Kinderlungenheilst., Sumperk. \*Bedeutung der Tomographie, Bronchoskopie und Bronchographie bei der Untersuchung tuberkulöser intrathorakaler Hiluslymphknoten. Significance of tomography, bronchoscopy and bronchography in the examination of intrathoracic hilar lymph glands SCHWEIZ. Z. TUBERK. 1955, 12/6 (434-445) illus. 14

In the era of chemotherapy of tb the accurate diagnosis of tubercular hilitis has become important. Tomography of the hilar region, bronchoscopy and bronchography lead to correct diagnosis. The author divides the pathological process into endobronchial lesions, as catarrhal, infiltrative, perforative and indurative, and lesions of the lymph nodes with consecutive atelectasis, obstructive emphysema or periglandular infiltrations.

Author's summary (XV, 7, 14)

EXCERPTA MEDICA Sec 15 Vol 12/7 Chest Dis. July 59

1743. SOME CURRENT PROBLEMS CONCERNING TUBERCULOSIS IN  
CHILDHOOD IN CZECHOSLOVAKIA - Quelques problèmes actuels de la  
tuberculose infantile en Tchécoslovaquie - Voitek V. Sanat. Sumperk,  
Tchécoslovaquie - POU MON 1958, 14/1 (61-70) Tables 5

The number of cases first increased noticeably since 1946 and decreased in the  
years 1955 and 1956. This is particularly obvious in destructive lung tb and in the  
meningitides. The number of cases in which the source of infection could be locat-  
ed has increased up to 70%, the parents being the main source. Prophylactic and  
therapeutic measures are discussed.

The experience of a combined team consisting of phthisiopaediatrician, surgeon and pathologist, with pulmonary resection in children is reported. The ages of the patients were between 3-16 yr. Forty-seven resections were performed for bronchiectasis 28 for tb, 13 for chronic pulmonary abscess and 2 for lymphosarcoma and echinococcus. Four children died. There were 3 deaths in the first operative period from 1949-1952. From the total of 90 resections there were 16 pneumonectomies, 61 lobectomies, 5 bilobectomies and 8 segmental resections. The individual indications are discussed. The main indication in tb was destroyed lung, then residual cavity after unsuccessful collapse therapy and tuberculoma. In 47 patients operated upon for bronchiectasis there were no deaths, in 28 patients with tb 1 child died and in 13 chronic abscesses 2 children and one patient with echinococcus died. "A Modified Child Psychiatric Card Index"

Prague, Ceskoslovenska Psychiatrie, Vol LIX, No 3, June 63, pp 159-166.

Abstract [Authors' English summary]: A modification of a card index hitherto employed for the analysis of clinical data recorded in outpatient and inpatient children's mental institutions. By means of this index it is easier to analyze data of previous history, etiology, diagnosis, syndromes, symptoms, and treatment. Its graphic arrangement and other texts are such as to replace both the previously used punch card and case notes. The card is described and instructions are provided on how to use it. It may be used in departments of adult psychiatry. Eighteen references, including 14 Czech.

Title : Myelomas Simulating Rheumatic Diseases

Orig Pub : Fysiatr. vest., 1957, 35, No 5, 286-295

Abstract : 3 cases of plasmacytomas are described. The initial clinical and roentgenographical pictures of these pointed to forming spondylosis, diffused osteoporosis and rheumatic arthritis, correspondingly. An unusually high sedimentation rate, dysproteinemia, the data of studies of punctates of the bone marrow, and in 2 patients data of autopsies and following histological investigations confirmed the diagnosis of plasmacytomas. Diffuse osteoporosis demonstrated in 2 patients running its course at first without foci of lysis is seldom observed, in

"Diagnosis and Treatment of Lupus Erythematosus Generalisatus"

Prague, Casopis Lekaru Ceskych, Vol 102, No 4, 25 Jan 63, pp 81-86.

Abstract: [Authors' English summary] The paper deals with diagnostic criteria in lupus erythematosus generalisatus and attention is drawn to the possibility of errors in evaluation of the phenomenon of lupus erythematosus cells and to the difficulties in the differential diagnosis between lupus erythematosus generalisatus and rheumatoid arthritis. In a group of 500 patients suffering from rheumatoid arthritis genuine lupus erythematosus cells occurred in 1.6 percent of cases, in other rheumatic disease the finding was always negative. Therapeutical possibilities in lupus erythematosus generalisatus are described with special reference to antimalaric and corticosteroid drugs. Attention is called to the necessity of administration of high doses of hormonal preparations and to the risk of complication from this treatment.

Abstract: A scientific conference on rheumatology was held in Prague, 21 to 23 May 1963. It was organized by the Research Institute for Rheumatic Diseases in Prague and Piestany in cooperation with the Rheumatological Section of the J.Ev. Purkyne Czechoslovak Medical Society (Ceskoslovenska lekarska spolecnost J.Ev. Purkyne). It was attended by foreign scientists, including American. A total of 50 papers were submitted on various problems of rheumatology.

2918. VOJTÍŠEK O. and MATĚJÍČEK V. Výzkumného Ústavu Chorób Reumatických, Praha. Projevy dřeňového útlumu při léčbě zlatem u chronické progressivní polyarthritis. Signs of depression of bone marrow activity in the treatment of rheumatoid arthritis with gold ČAS. LÉK. ČES. 1956, 95/32 (884-888) Graphs 7 Tables 1  
Out of 114 patients treated with gold, treatment had to be stopped in 21 patients, i. e. in 20.6%. Skin complications were found in 11.4%, haematological in 3.4% and disturbances of the gastrointestinal tract and kidneys in 1.7%. Only 2 cases with haematological disturbances required hospitalization and both improved after the usual treatment and ACTH. A cautious chrysothiotherapy rarely calls forth complications of the haemopoietic system and a careful and regular observation of the blood picture prevents fatal complications.

Experimental studies of the diurnal variation (daytime only) of the eosinophil count ČAS. LÉK. ČES. 1957, 96/18 (559-564) Graphs 11

The authors followed the physiological course of the absolute eosinophil count during the day at hourly intervals, with exclusion of pharmacodynamic effects from drugs and stress, in 25 rheumatics and 10 healthy controls. The curves may be divided into 3 types: symmetrical, variable, and flat. There is a count maximum in the morning hours, with a 50% difference between maximum and minimum values in the forenoon. The average morning decline in 50 daily curves from rheumatic was 40%, while in normals it was 50%. The components of the neurohumoral regulation of eosinophilia are discussed, the details of which are not known, and the relative value of the conclusion is discussed, based on changes in absolute eosinophil count without regard to physiological variation.

Prague, Casopis Lekarů Ceskych, Vol 105, No 22, 3 Jun 66, pp 601 - 602

Abstract [Authors' English summary modified]: Leucocytes from the urine of patients suffering from rheumatoid arthritis contain granular inclusions closely resembling inclusions in leucocytes in the synovial fluid (so-called R.A. cells), in patients of all ages. As the leucocytes in urine come from the blood, the inclusions are identical with granules described in leucocytes of patients suffering from rheumatoid arthritis. 1 Figure, 5 Western, 1 Czech reference.
